Ejercicio 1

Escriba un código que muestre un contador en el puerto A que incremente cada segundo.

Configure el oscilador interno a 4MHz.

Ejercicio 2

Escriba un código que configure el puerto A como salida y que recorra los pines del puerto encendiéndolos uno a uno, manteniendo encendido uno a la vez por un segundo. Es decir, enciende RA0 y apaga los demás por un segundo, luego enciende RA1 y apaga los demás por un segundo, así hasta llegar a RA7 e iniciar nuevamente con RA0.

Configure el oscilador interno a 4MHz.

Ejercicio 4

Defina un arreglo de 10 posiciones y guarde valores entre 0 y 20 (no repetidos) en cada una de las posiciones.

Agregue un contador (entre 0 y 20) y muestre el valor del contador en el puerto a, al presionar RB0 el valor del contador incrementa y al presionar RB1 el contador decrementa.

Si el valor del contador es igual al valor algún valor del arreglo, muestre el puerto c la posición del valor en el arreglo.
